GAS SENSOR MQ-2 IN PROTEUS USING ARDUINO

OBJECTIVES

- To interface the MQ-6 gas sensor with Arduino Uno using Proteus simulation.
- To read and monitor the gas sensor output through the Arduino's analog input.
- To display the sensor readings on the Virtual Terminal and control an LED based on the detected gas level.

PROGRAM

```
#define GreenLed 13

#define Sensor A0

void setup()
{
    pinMode(GreenLed, OUTPUT);
    pinMode(Sensor, INPUT);
    Serial.begin(9600);
}

void loop()
{
    int value = analogRead(Sensor);
    Serial.print("Analogic Value coming from the sensor : ");
    Serial.println(value);
    delay(100);
    if (value > 600)
    {
        digitalWrite(GreenLed, HIGH);
    }
    else
    {

```

```

digitalWrite(GreenLed, LOW);

}

delay(20);

}

```

OUTPUT
